| 2. Capital for expansion | Businesses need finances for expansion by purious investing in new product development. |
| Additional working capital | A business needs finance to pay for capital expenditure or revenue expenditure. |
| Research and Development | This is when a business needs to research to develop new products or invest in new marketing strategies. The same anywer for user of course in the same any user of course in the same anywer for user of course in the same and t |

Working capital

Definition: It is the amount of capital that is used to meet the day-to-day expenses of a business such as fuel, bills, raw material etc. It is important because it is regarded as the bloodline of a business. If any business fails to pay off suppliers of pay off the bills it might be forced to shut down. The way to improve the working capital is ask your debtors to pay you quickly and delay. payments to creditors. This helps to keep more cash leto the business. It can be calculated with the following formulae:

_Working Capital # Current Assets* Current Liabilities*] > Act of the definiti

* Current Assets: Short tern assets. These are held in the business for less than a year

* Current Liabilities Short term liabilities. These have to part off within a year

2. REVENUE EXPENDITURE AND CAPITAL EXPENDITURE

Definition | Revenue expenditure: Money to be spent on day-to-day expenses, for example wages, fuel and rent. These are regular expenditure that give benefit over the short term.

Definition | Capital Expenditure: Amount of money spent on non-current assets which will last for more than one year. E.g. Building, Car etc. These expenses are irregular and give benefit over a long-term or over a number of accounting periods.

sevenue Expenditure are used to maintain the eife on an asself.

Scanned by CamScanner

AS-Level - Business (9609) - SECTION 5 - [Finance and Accounting]

Significance of the distinction between revenue expenditure and capital expenditure It is important to distinguish between revenue and capital expenditure because of the following

- 1. Different impact on the business: These are two different kinds of business expenditure and have significantly different impacts on a business. Revenue expenditure is a regular expenditure, gives benefit over the short term, maintains rather than enhances assets. Capital expenditure is long-term, irregular, and produces benefit (assets) over a number of accounting periods.
- 2. Different in terms of how they are financed: They are almost certainly financed in different ways. Capital expenditure more likely to be financed with debt/loan financing whereas revenue expenditure is usually financed with better management of working capital, trade credit, credit cards etc.
- 3. Different in terms of how these types of expenditure are recorded in financial accounts: Revenue expenditure is on assets and expenses that give short term benefit to the business (1 year) and recorded in full on the Income Statement Capital expenditure will be recorded on the Income Statement as a yearly depreciation amount and on the Statement of Financial Position as asset valuation.

There are two financial accounts,

i) The income statement

ii) The belonce sheet which

busines

the details of the costet and liabile

TOPIC 2: SOURCES OF FINANCE

1. SHORT-TERM FINANCE AND LONG-TERM FINANCE

ii/ All the sources can be tested as seperate

Definition. These sources of finance provide for the working capital for day-to-day running of business operations. These types of sources have to be paid both wishin the year, example,

Definition: These sources of finance provide for a long term, which is more than a year. Usually used in the case of fixed assets, finance take oversetc. grample : Selling shares , Share holder .

2. INTERNAL SOURCES

Definition: An internal source of finance is the one that exists within a business. Following are . For every source you have to remember the internal sources of finance: i) I adventage and I dis act

- 1. Retained Profits
- 2. Sales of assets
- Sale and Leaseback
- Working Capital

term france of Definition: It is the profit after tax, that is required to business. It is a recommended source of finance since there is no cost of bold wing involved and the company doesn't need to sell more shares which maintains the owner wontrol of the company. However, might not be sufficient enough to finance large projects curthermore mew businesses won't have it and keeping profits in the business reduced partients to owners. Recommended for revenue expenditure and large businesses.

Source

Definition: Businesses often generate funds by offering their idle assets for sale, like machinery, land etc. in order to find a particular project. It is reconfined abut the tiens of borrowing and it have better use of the tiens proposition of the proposition and fixed assets are less liquid and take time to sell

3. Sale and Leaseback

Definition: In this a firm sells valuable assets and lease them back again. This allows the firm to gain capital from the sale as well as the firm still continues to use the asset which prevents disruptions in the business. However now the firm needs to pay for the use of asset which was previously free which reduces long term profits.

4. Working Capital

Definition: As discussed earlier the firm can better manage its working capital. This can be done through delaying payment to suppliers and asking debtors to pay quickly. This method is beneficial since it has no cost of borrowing however this might harm the relationship of the business with its suppliers and its customers. The suppliers might not be willing to supply or might not allow discounts on a longer credit period. Furthermore, customers would be reluctant

Question:

(a) Draw a break-even chart from the above-mentioned data

(b) Calculate the break-even point using the formulae

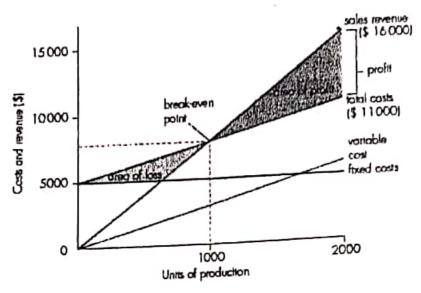

(c) Calculate the margin of safety

Answer:

(a) Whenever there is a question to draw the break-even chart make the following FOUR calculations:

| 1. Total Revenue = SP x Max Output | 8 x 2000 = \$16000 |
|--|----------------------------|
| 2. Total Variable Cost = VC x Max Output | 3 x 2000 = \$6000 |
| 3. Total Fixed Cost = Give in the Question | \$5000 |
| 4. Total Cost = TVC + TFC | \$6000 + \$5000 = \$11,000 |

AS-Level - Business (9609) - SECTION 5 - [Finance and Accounting]

(c)

Definition: The amount by which the sales exceeding break-even point, or in other words the range of output over which a profit can be made. This is the distance between the current output and the break-even point.

(d) Profits on Break Exe Profit = Margin of Safety $= 500 \times 5$ = \$2500

Can be testest as it much essey.

Advantages and Disadvantages of Break-Even Analysis Ret (b) of calculations. -> P-2

- 1. They can help take better location decisions. Since the location with a lower break-even would be preferred.
- 2. It can help take better marketing decisions, since it can tell the changes to the break-even point due to changes in price.
- 3. It can assist operations decisions with respect to fixed and variable costs. Machines with lower costs would be selected.
- 4. Break-even is easy to construct and interpret.
- It helps to make comparisons between different options by constructing charts and amend changes to the break-even point.

- Disadvantages
- 1. The break-even assumes that costs and revenues will always be represented by straight lines, however in reality this is not true. Some costs might not remain variable after a certain point.
- 2. Break even doesn't take into account semi variable counts. Which a partly fixed and partly variable. Example: Postpaid mobile bill, there is fixed line rent which includes certain minutes, after a certain limit, customers are charged per minute.
- 3 Break even assumes that all the units produced would be sold. This is an unrealistic assumption.
- Trassumes that fixed cost remains constant throughout the production. This is pot tine since after a point the company would need to invest in the factors of production to expand operations.

numerical data

. It only represents the qualitative quantitive data and no qualitaria information is mentioned, Henre, its recommended to use break even doing side other termiques like merter

- . Break even can only provide the number of units you need to sell, three strategy will still be build by the marketing dependment.
- · Depends on how reliable is data thre data
- · Break even has more significance for departments like operations and finance which rely more on quantitation decision making and less for HR which have a greater proposition for qualifetive judy conents

TOPIC 4: ACCOUNTING FUNDAMENTALS

Definition: An income statement is the document that records all the revenues and costs incurred by the business and helps in the calculation of profits. If you look at the Income statement closely it basically represents the same formulae of profit. Profit = Revenues - Costs

| | Income Statement | \$ |
|---------------------------------------|--|--|
| | | 100,000 |

2. Liabilities

Definition: These are items owed by the business.

| Definition. These are i | Description Least which have to be repaid after one year. Example: Long term bank |
|--------------------------------|--|
| 1 Long-term/Non- | Loan which have to be repair |
| current 2. Current Liabilities | loan, debentures etc. Amount owed which must be repaid within one year. Example: Creditors, |
| 2. 02. | l l l and death ala |
| 3. Net assets | This refers to the value of a company's assets minus its liabilities. |

3. Shareholders Capital / Shareholder's Equity

Definition: It is the total money invested into the business and is used to purchase a range of assets including machinery and inventories.

i) Share Capital: This is the money invested into the business by its owners through selling of) just mention them. shares.

ii) Reserves: These are company's accumulated retained profits.

3. RATIO ANALYSIS These can be tested as 3 mars assurable in P-2 Definition: Ratio analysis is used to evaluate an analysis aspects of a company's operating and financial performance such as its efficiency indicate profitability and solvency.

Profitability Ratios Volume Record 1000 1000 Definition. These measures the profits of the company as compared to its revenue. There are TWO profitability ratios:

- Gross Profit Margin
- 2. Operating Profit Margin / Profit Margin

1. Gross Profit Margin

Definition: Gross profit margin shows the gross profit as a percentage of sales. This ratio should Definition: Gross profit margin shows the gross profit as a percentage or sales. This ratio should be higher the better. This ratio carrying the triming partiting the principle policies and is a useful tool for managers intering of decision making.

Gross profit margin =

Gross Profit

Sales Revenue

x 100

Cithar the Met profit or Gross to Company to Company

Gross profit margin =
$$\frac{Gross\ Profit}{Sales\ Revenue} \times 100$$

2. Operating Profit Margin / Profit Margin

Definition: Operating profit margin shows the operating profit as a percentage of sales. This ratio should be higher the better. A high net profit margin suggests the other overheads like electricity bills, salaries etc. are low and sale price in rising or sales are increasing which is increasing profits.

Operating Profit Margin / Profit Margin= Operating Profit x 100

Liquidity Ratios Definition | Liquidity: It is the ability of a business to pay off its short-term debts. If the business cannot pay its suppliers for materials, or the business is unable to pay overdrafts it is said to be illiquid. The business that owes too much might be forced to stop trading and forced by creditors like banks and other businesses to sell business assets to pay off the debts.

Definition | Liquidity Ratios: These rations measure the ability of a business to pay-off its shortterm debts or liabilities.

(Methods) Evaluation :- 1) epends on the type of the business

AATIK TASNEEM | AS/A-LEVEL: BUSINESS (9609) | 03041122845

2) - Profesionly is also dependent on externed various there those vericles should be cops, the beton me decisions is timedical. 3) depends on the comperating Hestergy, if the market is mighly competition increasing mig

will be ten significant.

Definition: Current ratio gauges the ability of a business to pay off its short-term debts. A current ratio value of greater than 1 shows that the company is in a better position to pay off its debts. A 1. Current ratio ratio less than 1 can indicate serious cash flow problems since the company would have less assets to pay of the debts. An extremely high current ratio would mean too much working capital is tied up in unprofitable assets. An important point to note is that current ratio assumes that all the current assets can be quickly converted into cash which is not the case in reality. Idle current ratio 1.5 to 2.

$$Current \ ratio = \frac{Current \ Assets}{Current \ Llabilites}$$

Definition: Acid test provides a stricter analysis of a business to pay off its short-term debts. Inventories are deducted from the current assets since they are difficult to convert into cash. A ratio less than 1 can indicate serious cash flow problems since the company would have less assets to pay of the debts. An extremely high actionest ratio would mean too much working capital is tied up in unprofitable assets. Idle current tatio 1.0 to 2.

Limitations of Financial Ratios

- The value of the ratio itself doesn't hold much value and it needs to be compared with similar businesses to be more informative.
- 2. The value of accounts from which the ratios are created might be incorrect and can lead to misleading results.
- 3. The ratios can only predict problems but don't suggest methods to solve them. In this case, several other qualitative and quantitate methods must be discussed to reach an appropriate solution.
- 4. Comparison with other companies and evaluating employee's performance based on those figures might be disastrous. Since the other company might use different ways to value assets or have window dressed accounts which shows positive results. In this case the company's employee might be demotivated.

Uses and Users of financial accounts

| Uses and Users of financial accounts | | |
|--------------------------------------|--|--|
| Users | Description | |
| 1. Managers | 1. Better decision making thelp in expansion, change price levels | |
| | etc. | |
| | 2. Ratios provide a quel analysis to compare performance over the | |
| | years. | |
| 2. Shareholders | 1. How much profit a company a making. | |
| | 2. Helps in investmental ecisions | |
| | 3. Gauge the worth at the business. | |
| 3. Creditors | 1. Will tell the businesses ability to have off debts. | |
| | 2. Supplier might not give goods it the liquidity is poor. | |
| 4. Banks | 1. Use them for giving loans. | |
| | 2. Want to check the liquidity. | |
| 5. Government | Uses the accounts for taxes | |
| A A | 2 Monitor business activity | |
| 6. Workers and | 1 Check the statements for pay raise. | |
| Trade Unions | For better working conditions | |
| 7. Other businesses | for comparisons | |
| (Competitors) | Use them for comparisons. Helps in deciding the value in take overs mergers. | |

Limitations of Published Accounts

- 1. These accounts don't show details about the sales and profitability of each good and service.
- 2. The future plans of the business about R&D and new products are not shown.
- 3. The quality of leadership and other qualitative variables like employee motivation is not shown by the financial data. These include the skills of the senior managers etc.
- 4. The information in the accounts is old and may not be relevant for the future.
- 5. These accounts might be window dressed. Window dressing is presenting the company accounts in a favorable light to influence the banks to lend more or encourage investors to buy more share. This can be done by overstating assets, reducing depreciation, giving stocks a higher value, delaying expenses till the accounts published etc.

TOPIC 5: FORECASTING AND MANAGING CASH FLOWS

1. PURPOSES OF CASH FLOW FORECASTS

1. Difference between cash and profits

Cash is the physical movement of money within the business. Whereas profit on the other hand is the surplus after all the total costs have been deducted from sales revenue. This shows that a business that is profitable doesn't necessarily have to have cash and vice versa.

Example: A business sells goods worth \$10,000 and It costed \$5000 to make those goods. The profit comes out to be \$5000. However, for the goods sold worth \$10,000 only \$5000 cash is received.

2. Why cash is important to a business?

1. Cash helps the business pay of its day to day expenses like workers, suppliers, etc.

2. Cash is essential for production of goods and services. The firm needs to buy raw material essential for production and pay of workers to make sure they keep working.

3. The business might have to liquidate its fixed assets due to unavailability of cash.

2. CASH FLOW FORECASTS IN PRACTICE

Definition | Cash Flow: It is the movement of cash propagation and out of a business over a period of time. It is also known as net monthly cash liow

Cash Flow = Cash Inflow Cash Outflow

Definition | Cash-flow Forecast: It is the assignate of a norms suture cash inflows and outflows. A cash flow forecast has the following elements:

- 1. Cash Inflows
- 2. Cash Outflows
- 3. Opening Balance
- 4. Closing Balance

1. Cash Inflows

Definition: These are payments in cash received by a business, such as those from customers or from banks in the form of a loan.

2. Cash Outflows

Definition: These are payments made in cash by a business, such as those to suppliers and workers.

3. Opening Balance

Definition: This is the business's cash position at the start of a month.

4. Closing Balance

Definition: The balance of cash at the end of the month. It can be calculated with the following formulae:

Closing Balance = (Cash Inflow - Cash Outflow) + Opening Balance

Sample Exam Question: (O/N 2016, V2) | Q2

| | Month 1 (\$) | Month 2 (\$) | Month 3 (\$) | Month 4 (\$) |
|-------------------|--------------|--------------|--------------|----------------|
| Cash inflows: | Marine Marin | | | |
| Cash sales | 10 000 | 10000 | 10000 | 10000 |
| Trade receivables | 2000 | 2000 | 2000 | 15000 |
| Total cash in | 12000 | 12000 | 12000 | 25000 |
| Cash outflows: | | | | instruction in |
| Factory rent | 2000 | 2000 | 2000 | 2000 |
| Cost of sales | 8000 | 16000 | 8000 | 8000 |
| Insurance* | 12000 | 0 | 0 | 0 |
| Electricity** | 3000 | 0 | 0 | 3000 |
| Total cash out | 25000 | 18000 | 10000 | 13000 |
| Opening balance | 10000 | (3000) | (9000) | (7000) |
| Closing balance | (3000) | (9000) | (7000) | 7 |

*Insurance is paid once a year

**Electricity is paid once a quarter (every three months)

Question: Calculate the value of Z

Answer: Closing Balance = (Cash Inflow : Cash Ohir ow) + Opening Balance

= (\$25,000 - \$55,000) = (\$7,000)

= \$5000

Advantages and Disadvantages of Cash Flow Forecasts

Advantages

- 1. It can be used to predict cash imbalances in terms of amount and duration. This can help the business managers plan ahead. If the business expects surplus cash it camplan investment options where as if there is liquidity problem it can apply for loans now.
- 2. It can allow government authorities to rely on it to certain extent for calculation of taxes.
- 3. Suppliers can look at the cash flows to assess the liquidity position. Businesses with good cash reserves might get longer credit periods and relaxed terms of payments.
- 4. Forecasts will aid potential investors and lending institutions to assess financial needs and requirements of a new business and its ability to pay off debts and according to that give the finance.

Disadvantages

- 1. Misrakes can be made when prepaying inflows and outflows. This problem might me more for new entrepreneurs who are inexperienced
- 2. Inaccurate assumptions about the future level of sale or price of the products. This may be due to poor market research.
- 3. Unexpected increase in costs may lead to major inaccuracies. These can be due to major external environmental changes. Example: Minimum wage might go up, oil prices suddenly spike up, unexpected machinery breakdown interest rates increase etc.
- 4. These figures is the statement might be window dressed to attract investors. Inflows might be overstated whereas outflows might be understated.

Evaluation: The above-mentioned disadvantages does not make cash flow useless however they Evaluation: The above-mentioned disadvantages does not make cash flow discloss however they should be used to caution. Researching the market reading prices, suppliers, cost of raw material should be used to caution. Researching the market reaches prices, supplied, cost of raw material etc. can improve the accuracy. Furthermore, of the firm hire specialists and use technology like etc. can improve the accuracy. Furthermore, of the first and specialists and use combining first spreadsheets to construct and monitor cash-flow forecasts since it would not only make them simpler but also quicker to amend.

3. METHODS OF IMPROVING CASH FLOW

| 3. METHODS OF DVI ROUTE AND A STANDARD AND A STANDA | | |
|--|--|--|
| | This is when a business fails to forecast the timing of the expenditure and income which leads to the crises. This is when the credit control department doesn't collect debts on time. This leads to delayed payments or bad debts where customers don't end up paying | |
| 3. Extended credit periods | at all. This happens when a business gives an extended credit period to attract customers. However, if the policy is too extended it might face cash difficulties. | |
| 4. Overtrading | This is when a business expande to quickly without organizing funds to mande the expansion. This happens because expenses of labor and raw material have | |
| 5. Unexpected events | When factors outside the food of the business lead to cash flow problems. Example: Minimum wage might to up oil prices suddenly spike up, unexpected machinery or a shown interest rates increase etc. | |

2. Methods of improving cash flow

There are TWO ways to improve cash

- 1. Increase cash inflows
- 2. Decrease cash outflows

1. Increase cash inflows

Use all the sources of tipance men

| 2. Decrease cash outflows | | |
|---------------------------|---|--|
| Method | Description Programme and the | |
| 1. Delay payments | Cash outflow will reduce in the short run nowever suppliers might not be | |
| to suppliers | willing to supply or might not allow discounts on a longer credit period. | |
| 2. Delay spending | Cash outflow will reduce however business efficiency might call due to | |
| on capital | poor equipment leading to competitors taking an edge over the company. | |
| equipment. | Furthermore it might restrict expansion. | |
| 3. Use leasing not | Since not cash outlay is required will reduce outflow however asset would | |
| buying capital | not be owned by the businesses which restricts its freedom of use and | |
| right away | furthermore leasing payment will reduce profits. | |
| 4. Cut overheads | Cut expenses like lighting and promotion. This will improve the efficiency | |
| 4. Cut overneads | however lack of promotion might reduce demand for the product reducing | |
| | sales and ultimately profits. Furthermore, in order to reduce overheads firm | |
| | might need efficient machinery which increases outflow. | |
| | inight need enterest machines, | |
